

ARTHUR LI

ABSTRACT ALGEBRA

Introduction

THIS COLLECTION of notes serve as a guide to mastering abstract algebra with content from undergraduate to graduate level course. The notes combine knowledge from different sources, including course notes and textbooks used in the courses.

Prerequisites

These notes will assume no familiarity with any aspects of abstract algebra, and builds upon the foundation from Group Theory to more abstract topics such as Categories and Commutative Algebra. A good starting point will be the series on [Visual Group Theory](#) by [Professor Matthew Macauley](#).

Familiarity with basic styles of proof is assumed (contradiction, contrapositive, etc.).

Organization and Sources

This section will be edited as the notes progress towards completion.

1 Preliminaries

1.1 Introductory Ideas and Definitions

Definition 1.1.1. *Class* is a collection A of objects (elements) such that given any object x it is possible to determine if x is a member of A .

Definition 1.1.2. *Axiom of extensionality* asserts that two classes with the same elements are equal.
(Formally, $[x \in A \iff x \in B] \Rightarrow A = B$).

Definition 1.1.3. A class is defined to be a *set* if and only if there exists a class B such that $A \in B$.
A class that is not a set is called a *proper set*.

Definition 1.1.4. *Axiom of class formation* asserts that for any statement $P(y)$ in the first predicate calculus involve a variable y , there exists a class A such that $x \in A$ if and only if x is a set and the statement $P(x)$ is true. The class is denoted $\{x|P(x)\}$.

Definition 1.1.5. A class A is a *subclass* of class B ($B \supset A$) provided $\forall x \in A, x \in A \iff x \in B$.
A subclass A of a class B that is itself a set is called a *subset* of B .
The *empty or null set* (denoted \emptyset) is the set with no elements.

Definition 1.1.6. *Power axiom* asserts that for every set A the class $P(A)$ of all subsets of A is itself a set. $P(A)$ is the *power set* of A , denoted 2^A .

Definition 1.1.7. A *family of sets* indexed by (nonempty) class I is a collection of sets A_i , one for each $i \in I$ (denoted $\{A_i|i \in I\}$).

The *union* is defined as $\bigcup_{i \in I} A_i = \{x|x \in A_i \text{ for some } i \in I\}$.

The *intersection* is defined as $\bigcap_{i \in I} A_i = \{x|x \in A_i \text{ for every } i \in I\}$.

If $A \cap B = \emptyset$, then A and B are disjoint.

Definition 1.1.8. The *relative complement* of A in B is the following subclass of B : $B - A = \{x|x \in B \text{ and } x \notin A\}$. If all classes under discussion are subsets of some fixed set U (the universe of discussion), then $U - A = A'$ is the *complement* of A .

Definition 1.1.9. Given classes A and B , a **function / map / mapping** f from A to B (written $f : A \rightarrow B$ assigns to each $a \in A$ exactly one element $b \in B$).

Then b is the value of function at a , or the **image** of a , written $f(a)$.

A is the **domain** of the function, written $\text{dom } f$, and B is the **range** or **codomain**.

Two functions are **equal** if they have the same domain and range, and have the same value for each element of their common domain.

Definition 1.1.10. If $f : A \rightarrow B$ is a function and $S \subset A$, the function from S to B given by $a \mapsto f(a)$, for $a \in S$, is **restriction** of f to S , denoted $f|_S : S \rightarrow B$.

If $S \in A$, the function $1_A|_S : S \rightarrow A$ is the **inclusion map** of S into A .

Definition 1.1.11. Let $f : A \rightarrow B$ and $g : B \rightarrow C$ be functions. The **composite** of f and g is the function $A \rightarrow C$ given by $a \mapsto g(f(a))$, $a \in A$. This is denoted $g \circ f$ or simply gf .

Definition 1.1.12. The **diagram of functions** is said to be commutative if $gf = h$, or if $kh = gf$.

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ & \searrow h & \swarrow g \\ & C & \end{array} \quad \begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow h & & \downarrow g \\ C & \xrightarrow{k} & D \end{array} \quad (1.1)$$

Definition 1.1.13. Let $f : A \rightarrow B$ be a function. If $S \in A$, the **image of S under f** (denoted $f(S)$) is the class $\{b \in B | b = f(a) \text{ for some } a \in S\}$.

The class $f(A)$ is the **image of f** , denoted $\text{Im } f$.

If $T \subset B$, the **inverse image of T** under f (denoted $f^{-1}(T)$), is the class $\{a \in A | f(a) \in T\}$.

Definition 1.1.14. A function $f : A \rightarrow B$ is said to be **injective** (or one-to-one) provided $\forall a, a' \in A, a \neq a' \Rightarrow f(a) \neq f(a')$, or $f(a) = f(a') \Rightarrow a = a'$.

A function f is **surjective** (or on-to) provided $f(A) \approx B$; in other words, for each $b \in B$, $b = f(a)$ for some $a \in A$.

A function f is **bijective** (or one-to-one correspondence) if it is both injective and surjective.

Definition 1.1.15. The map $g : B \rightarrow A$ is a **left inverse** of f if $gf = 1_A$.

The map $h : B \rightarrow A$ is a **right inverse** of f if $fb = 1_B$.

If a map $f : A \rightarrow B$ has both a left inverse g and a right inverse h , then $g = g1_B = g(fh) = (gf)h = 1_Ah = h$, and $g = h$ is the **two-sided inverse**.

4 Ring Theory

4.1 Basic Axioms

Definition 4.1.1. A **ring** is a nonempty set R with two binary operations $+$ (addition) and \times (multiplication), $(R, +, \times)$, such that:

- (i) $(R, +)$ is an additive abelian group with 0 as the additive identity
- (ii) the binary operation \times is associative: $(a \times b) \times c = a \times (b \times c)$, $\forall a, b, c \in R$
- (iii) left and right distributive laws: $(a + b) \times c = (a \times c) + (b \times c)$, $a \times (b + c) = (a \times b) + (a \times c)$, $\forall a, b, c \in R$.

Definition 4.1.2. If in addition to definition of ring, $a \times b = b \times a \forall a, b \in R$, then R is a **commutative ring**.

Definition 4.1.3. The ring R has a **multiplicative identity** if there is an element $1_R \in R$ such that $1_R \times a = a \times 1_R = a$, $\forall a \in R$.

The ring R has a **additive identity** if there is an element $0_R \in R$ such that $a - b = a + (-b) = 0_R$, where $-b$ is the **additive inverse**.

Definition 4.1.4. A **division ring** R is a ring such that:

- (i) R has a multiplicative identity 1_R ;
- (ii) $1_R \neq 0_R$; and
- (iii) \forall nonzero element $a \in R \setminus \{0\}$ has a unique multiplicative inverse a^{-1} such that $aa^{-1} = 1 = a^{-1}a$

Definition 4.1.5. A **field** is a division ring which is commutative.

If R is a division ring (field), then (R, \times) is a (commutative) **multiplicative group**, $R^\times = R \setminus \{0\}$.

Definition 4.1.6. Let $F = (F, +, \times)$ be a field. A nonempty subset $E \subseteq F$ is a **subfield** if:

- (i) $(E, +)$ is an additive subgroup of $(F, +)$;
- (ii) E is closed under multiplication \times : $a, b \in E \Rightarrow a \times b \in E$;
- (iii) $1_F \in E$; and
- (iv) $a \in E \setminus \{0\} \Rightarrow a^{-1} \in E$

Remark 4.1.7. The *trivial ring* is $\{0\}$.

The *integer ring* is $(\mathbb{Z}, +, \times)$ with 1, but is neither a division ring or field.

$n\mathbb{Z} = \{ns | s \in \mathbb{Z}\}$ is a subring of \mathbb{Z} .

$(\mathbb{Z}/n\mathbb{Z}, +, \times)$ is a commutative ring with 1 for $n \geq 2$.

Remark 4.1.8. The 2-dimensional vector space $\mathbb{Q}[\sqrt{D}] = \mathbb{Q} + \mathbb{Q}\sqrt{D} = \{a + b\sqrt{D} | a, b \in \mathbb{Q}\}$ with \mathbb{Q} -basis $\{1, \sqrt{D}\}$ is a *Quadratic Field*.

Define $\mathbb{Q}(\sqrt{D}) = \left\{ \frac{a+b\sqrt{D}}{c+d\sqrt{D}} | a, b, c, d \in \mathbb{Q}, c+d\sqrt{D} \neq 0 \right\}$. Then $\mathbb{Q}(\sqrt{D}) = \mathbb{Q}[\sqrt{D}]$.

More generally, for a field F , $\mathbb{Q}(F) = \left\{ \frac{\alpha}{\beta} = \alpha\beta^{-1} | \alpha, \beta \in F, \beta \neq 0 \right\} = F$.

Remark 4.1.9. Let $H = \mathbb{R} + \mathbb{R}i + \mathbb{R}j + \mathbb{R}k = \{a + bi + cj + dk | a, b, c, d \in \mathbb{R}\}$ be the 4-dimensional vector space over \mathbb{R} with \mathbb{R} -basis $(1, i, j, k)$.

The multiplication is extended linearly by distributive law: $i^2 = j^2 = k^2 = -1$, $ij = k = -ji$, $jk = i = -kj$, $ki = j = -ik$. Then H is a *Real Quaternion Ring*.

$H_{\mathbb{Q}} = \mathbb{Q} + \mathbb{Q}i + \mathbb{Q}j + \mathbb{Q}k = \{a + bi + cj + dk | a, b, c, d \in \mathbb{Q}\}$ is the *Rational Hamilton Quaternion Ring*.

Remark 4.1.10. Let $\mathbb{R}V[x] = \{f : \mathbb{R} \rightarrow \mathbb{R}\}$ be the set of all real-valued functions. Let $x \mapsto c(x) = c$ be a constant function.

For $f, g \in \mathbb{R}V[x]$, the natural addition is $x \mapsto (f + g)(x) = f(x) + g(x)$.

The multiplication (not composition) is $x \mapsto (fg)(x) = f(x)g(x)$.

The $(\mathbb{R}V[x], +, \times)$ is a commutative (*real valued-function*) *ring* with multiplicative identity 1 being the constant function 1.

Definition 4.1.11. Let R be a ring with $1 \neq 0$. An element $u \in R$ is a *unit* if it has a multiplicative identity inverse u' such that $uu' = 1 = u'u$.

The *set of all units* of R are $U(R) = \{u \in R | u \text{ is a unit}\}$.

The *multiplicative group of units of the ring* R is $(U(R), \times)$.

Remark 4.1.12. More generally, let X be a set and R be a ring. Let $X_{t_0}R := \{f : X \rightarrow R\}$ be the set of all maps between X and R . Then for $f, g \in X_{t_0}R$, there are natural addition $f + g$ and multiplication fg ($x \mapsto f(x)g(x)$) as in previous remark.

Then $(X_{t_0}R, +, \times)$ is a ring, called the *R-Valued Function Ring*.

If R has 1 then so does $X_{t_0}R$. If R is commutative then so does $X_{t_0}R$.

Every $c \in R$ defines a constant function (an element in $X_{t_0}R$, $c : X \rightarrow R$; $x \mapsto c(x) = c$).

Identify R with the subset of $X_{t_0}R$ of constant function. Then R is a subring of $X_{t_0}R$.

Remark 4.1.13. Let $n \geq 2$. Then $U(\mathbb{Z}/n\mathbb{Z})$ is a commutative multiplicative group of order $|U(\mathbb{Z}/n\mathbb{Z})| = \varphi(n)$. Hence $\varphi(n)$ is the *Euler's φ -function*, $\varphi(n) = |\{1 \leq s \leq n | \gcd(s, n) = 1\}|$.

Definition 4.1.14. An *Integral Domain* is a commutative ring with $1 \neq 0$ such that $\forall a, b \in R$, $ab = 0 \Rightarrow a = 0$ or $b = 0$, or equivalently, $\forall a, b \in R$, $a \neq 0$, $b \neq 0 \Rightarrow ab \neq 0$.

\mathbb{Z} is an integral domain.

Every field is an integral domain.

Definition 4.1.15. Let R be a ring. A nonzero element $a \in R$ is a **zero divisor** if there is a nonzero $b \in R$ such that either $ab = 0$ or $ba = 0$.

A commutative ring R with 1 is an integral domain if and only if R has no zero divisors.

Proposition 4.1.16. Let R be a ring with $1 \neq 0$. Then R is an integral domain if and only if the cancellation law holds: $\forall a, b, c \in R, c \neq 0, ca = cb \Rightarrow a = b$.

Corollary 4.1.17. Let R be a finite integral domain, i.e., R is an integral domain with the cardinality $|R| < \infty$. Then R is a field.

Proposition 4.1.18. Let $n \geq 2$. Then the following are equivalent:

- (i) $\mathbb{Z}/n\mathbb{Z}$ is a field
- (ii) $\mathbb{Z}/n\mathbb{Z}$ is an integral domain
- (iii) n is a prime

Definition 4.1.19. Let R be a ring. A nonempty subset $S \subseteq R$ is a **subring** of R if:

- (i) $(S, +)$ is an additive subgroup of $(R, +)$ and
- (ii) S is closed under multiplication

$$\mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C}$$

Proposition 4.1.20. (Subring Criterion) Let R be a ring and $S \subseteq R$ a nonempty subset. Then the following are equivalent:

- (i) S is a subring of R
- (ii) S is closed under subtracting and multiplication: $a, b \in S \Rightarrow ab \in S; a - b = a + (-b) \in S$

Remark 4.1.21. Being a subring is a transitive condition. If R is a subring of S and S is a subring of T , then R is a subring of T .

If both S_i are subrings of R and $S_1 \subseteq S_2$, then S_1 is a subring of S_2 .

Remark 4.1.22. (Subring without 1) If R is a ring with $1 = 1_R$ then a subring $S \subseteq R$ may not contain 1 , i.e., $m\mathbb{Z} = \{ms \mid s \in \mathbb{Z}, |m| \geq 2\}$ is a subring of \mathbb{Z} which does not contain 1 .

Remark 4.1.23. (Intersection of subrings) Let R_α ($\alpha \in \Sigma$) be a (not necessarily finite or countable) collection of subrings of a ring R . Then the intersection $\bigcap_{\alpha \in \Sigma} R_\alpha$ is a subring of R .

Generally, the union of subrings may not be a subring.

Remark 4.1.24. (*Union of ascending subrings*) Let $R_1 \subseteq R_2 \subseteq \cdots$ be an ascending chain of subrings R_i of a ring R . Then the union $\bigcup_{i=1}^{\infty} R_i$ is a subring of R .

Remark 4.1.25. (*Addition of subrings*) Let R be a ring and let R_i be subrings of R .

Then the addition $R_1 + \cdots + R_n$ is closed under subtraction, but may not be closed under multiplication, hence may not be a subring of R .

Remark 4.1.26. (*Integral domain is a subring of a field*)

Let F be a field. Let $R \subseteq F$ be a subring such that $1 \in R$. Then R is an integral domain.

Every integral domain R is a subring of some field $\mathbb{Q}(R)$ (the fractional field of R).

Remark 4.1.27. (*Product of Rings*) let $n \geq 1$ and let $R_i = (R_i, +, \times)$ ($i = 1, \dots, n$) be rings.

Then the direct product is a ring, $R = R_1 \times \cdots \times R_n$. (The direct product is $(a_1, \dots, a_n) \times (a'_1, \dots, a'_n) = (a_1 a'_1, \dots, a_n a'_n)$).

The unit subgroups has the relation $U(R) = U(R_1) \times \cdots \times U(R_n)$

4.2 Examples of Rings

Definition 4.2.1. The (*polynomial ring $R[x]$ over a ring R*) is $(R[x], +, \times)$,

where $R[x] = \{\sum_{j=0}^d b_j x^j \mid d \geq 0, b_j \in R\}$.

There are natural addition and multiplication operations for polynomials.

Remark 4.2.2. Let R be a commutative ring with 1. Let $S := R[x]$ be the polynomial ring over R .

(i) R is a subring of S which consists of constant polynomial functions.

(ii) $0_S = 0_R$

(iii) S contains $1 = 1_S$, and $1_S = 1_R$.

Proposition 4.2.3. (*Polynomial ring over integral domain*) Let R be an integral domain. Let $f(x), g(x) \in R[x]$. Then

(i) $\deg(f(x)g(x)) = \deg(f(x)) + \deg(g(x))$

(ii) $U(R[x]) = U(R)$. Namely, $g(x)$ is a unit of $R[x]$ if and only if $g = a_0 \in R$ (constant polynomial) with a_0 a unit in R .

(iii) $R[x]$ is an integral domain

Remark 4.2.4. The (*matrix ring of $n \times n$ square matrices with entries in the ring R*) is defined as $(M_n(R), +, \times)$, where

$$M_n(R) = \left\{ A = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix} \mid a_{ij} \in R \right\}$$

If $A = (a_{ij}), B = (b_{ij}) \in M_n(F)$, then $A + B = (a_{ij} + b_{ij}), AB = (c_{ij})$ where $c_{ij} = \sum_{k=1}^n a_{ik}b_{kj}$.
 $A = (a_{ij}) = \text{Diag}[a_{11}, \dots, a_{nn}]$ is a diagonal matrix if $a_{ij} = 0$ ($i \neq j$).
 $A = (a_{ij}) = \text{Diag}(a_1, \dots, a_n)$ is a scalar matrix if $a_{ii} = a \in R \forall i$, and $a_{ij} = 0$ ($i \neq j$).
 $A = (a_{ij})$ is an upper triangular matrix if $a_{ij} = 0$ ($i < j$). The lower triangular matrix is defined similarly.

Remark 4.2.5. Let R be a ring and $S = M_n(R)$ the matrix ring with entries in R . Then

- (i) $0_S = (a_{ij})$ where $a_{ij} = 0$ (the zero matrix)
- (ii) If R has $1 = 1_R$, then S also has $1 = 1_S$ with $1_S = \text{Diag}[1_R, \dots, 1_R]$
- (iii) The set $S_{c_n}(R) = \{\text{Diag}[a, \dots, a] | a_i \in R\}$ of all scalar matrices in $M_n(R)$ is a subring of $M_n(R)$. There is a natural ring isomorphism $R \cong S_{c_n}(R)$.
- (iv) The set $D_n(R) = \{\text{Diag}[a_1, \dots, a_n] | a_i \in R\}$ of all diagonal matrices in $M_n(R)$ is a subring of $M_n(R)$. There is a natural ring isomorphism $D_n(R) \cong R^n := R \times \dots \times R$ (n times).
- (v) The set $UT_n(R) := \{(a_{ij}) | (a_{ij} \in R, (a_{ij} = 0 (\forall i > j)))\}$ of all upper triangular matrices in $M_n(R)$ is a subring of $M_n(R)$. Similarly, the set $LT_n(R)$ of all lower triangular matrices in $M_n(R)$ is a subring of $M_n(R)$.
- (vi) If R is a subring of R , then $M_n(T)$ is a subring of $M_n(R)$
- (vii) Even if R is commutative, $M_n(R)$ may not be commutative when $n \geq 2$.
- (viii) If $n \geq 2$, then $M_n(R)$ is not an integral domain (even when R is a field).

Definition 4.2.6. Let R be a ring with 1. Set $GL_n(R) := U(M_n(R))$ the set of all units in $M_n(R)$. Then $GL_n(R)$ is a multiplicative group called the **general linear group of degree n over R** .

Definition 4.2.7. Let R be a commutative ring with 1. Define determinant $\det(A) = |A|$, Let $SL_n(R) := \{A \in M_n(R) | \det(A) = 1\}$ be the set of all matrices in $M_n(R)$ with determinants equal to 1. Then $SL_n(R)$ is a multiplicative subgroup of $GL_n(R)$ called the **special linear group of degree n over R** .

Definition 4.2.8. (Group Rings $R[G]$)

Let R be a commutative ring with $1 \neq 0$. Let $G = \{g_1, \dots, g_n\}$ be a finite multiplicative group of order n . Then $R[G]$ is a **group ring**, where $R[G] = Rg_1 + \dots + Rg_n = \{a_1g_1 + \dots + a_ng_n | a_i \in R\}$.
Natural addition is defined as $(\sum_{i=1}^n a_i g_i) + (\sum_{i=1}^n b_i g_i) = (\sum_{i=1}^n (a_i + b_i) g_i)$.
Multiplication is defined as $(\sum_{i=1}^n a_i g_i) \times (\sum_{j=1}^n b_j g_j) := (\sum_{k=1}^n c_k g_k)$ where $c_k = \sum_{g_i g_j = g_k} a_i b_j$ with the sum running $\forall (i, j)$ with $g_i g_j = g_k$.

Remark 4.2.9. Let R be a commutative ring with $1 \neq 0$, G a multiplicative group, and $R[G]$ the group ring. Then

- (i) $R[G]$ is a commutative ring if and only if G is commutative (=abelian) group
- (ii) $R[G]$ has the multiplicative identity $1 = 1_{Re_G}$

Remark 4.2.10. Let $R[G]$ be a group ring.

(i) There is a natural injective ring homomorphism $R \rightarrow R[G]; r \mapsto re_G$. Identify R with the image Re_G of this injective homomorphism.

- (ii) For every $g \in G$, the element $1_R g$ is a unit in $R[G]$
- (iii) There is a natural injective group homomorphism $G \rightarrow U(G[R]); g \mapsto 1_R g$. Identify G with the image $1_R G$ of this injective homomorphism.
- (iv) If S is a subring of R , then $S[G]$ is a subring of $R[G]$. If H is a subgroup of G , then $R[H]$ is a subring of $R[G]$.
- (v) $T = \{\sum_{i=1}^n a_i g_i \in R[G] \mid \sum_{i=1}^n a_i = 0\}$ is a subring of $R[G]$ (an ideal of $R[G]$)

Remark 4.2.11. When R is a division ring or field, then $R[G]$ (as an additive group) is a vector space over R of dimension equal to $|G|$ with basis $\{g_1, \dots, g_n\} = G$. Hence $R[G] = Rg_1 + \dots + Rg_n = Rg_1 \oplus \dots \oplus Rg_n$, the direct sum of 1-dimensional vector subspaces Rg_i over R .

4.3 Ring Homomorphisms

Definition 4.3.1. Let R, S be rings. A map $\varphi : R \rightarrow S$ is a **ring homomorphism** if it respects the additive and multiplicative structures.

$$\begin{aligned}\varphi(a + b) &= \varphi(a) + \varphi(b) \quad \forall a, b \in R \\ \varphi(ab) &= \varphi(a)\varphi(b) \quad \forall a, b \in R\end{aligned}$$

Definition 4.3.2. Let R, S be rings. A map $\varphi : R \rightarrow S$ is a **ring isomorphism** if it is a ring homomorphism and bijective. This is denoted $\varphi : R \xrightarrow{\sim} S$. Rings R and S is **isomorphic**, denoted $R \cong S$ or $R \simeq S$.

Definition 4.3.3. The **kernel** of a ring homomorphism φ is defined as $\ker \varphi = \varphi^{-1}(0_S) = \{a \in R \mid \varphi(a) = 0_S\}$.

Remark 4.3.4. (Examples of homomorphism)

- (i) Let R, S be rings. The map $R \rightarrow S, a \mapsto 0$ is a **zero or trivial map / homomorphism**.
- (ii) Suppose R_1 is a subring of a ring R . The map $\iota : R_1 \rightarrow R, a \mapsto a$ is a **inclusion homomorphism**.
- (iii) Let $n \in \mathbb{Z}$. The quotient map $\mathbb{Z} \rightarrow \mathbb{Z}/n\mathbb{Z}, s \mapsto \bar{s} = [s]_n$ is a **quotient homomorphism** between additive groups $(\mathbb{Z}, +)$ and $((\mathbb{Z})/n(\mathbb{Z}), +)$.
- (iv) Let X be a set, R a ring, and $X_{t_0}R = \{f : X \rightarrow R\}$ the ring of all maps from X to R . Fix an element $c \in R$. Then $E_c : X_{t_0}R \rightarrow R; f \mapsto E_c(f) := f(c)$ is a **function evaluation map**, called the **Evaluation at c** .

Proposition 4.3.5. Let R, S be rings and $\varphi : R \rightarrow S$ be a ring homomorphism. Let $R_1 \subseteq R$ be a subring. Then

- (i) The φ -image $\varphi(R_1) = \{b \in S \mid b = \varphi(a) \text{ for some } a \in R_1\}$ is a subring of S .
- (ii) $\ker \varphi$ is a subring of R such that $\forall a \in R, \forall k \in \ker \varphi \Rightarrow ak \in \ker \varphi$. In other words, $\ker \varphi$ is a subring of R , $R(\ker \varphi) \subseteq \ker \varphi$ and $(\ker \varphi)R \subseteq \ker \varphi$.

Definition 4.3.6. Let R be a ring, $I \subseteq R$ a subset and $r \in R$. The subset $I \subseteq R$ is a **left-ideal** of R if:

- (i) I is a subring of R ; and

(ii) I is closed under left multiplication by elements from R : $rI \subseteq I$ ($\forall r \in R$), i.e., $RI \subseteq I$.

Definition 4.3.7. Let R be a ring, $I \subseteq R$ a subset and $r \in R$. The subset $I \subseteq R$ is a **right-ideal** of R if:

(i) I is a subring of R ; and

(ii) I is closed under right multiplication by elements from R : $Ir \subseteq I$ ($\forall r \in R$), i.e., $IR \subseteq I$.

Definition 4.3.8. Let R be a ring, $I \subseteq R$ a subset and $r \in R$. The subset $I \subseteq R$ is a **(two-sided) ideal** of R if is both a left-ideal and right-ideal. In other words, $RI \subseteq I$ and $IR \subseteq I$.

Proposition 4.3.9. (Ideal Criterion) Let R be a ring and I a nonempty subset of R . The following are equivalent:

(i) I is a two-sided ideal of R ;

(ii) $\forall r \in R, \forall a, b \in I \Rightarrow ra, ar, a - b \in I$

(iii) (If R is commutative) $\forall r \in R, \forall a, b \in I \Rightarrow ra, a - b \in I$

(iv) (If R is commutative with 1) $\forall r \in R, \forall a, b \in I \Rightarrow a + rb \in I$

Proposition 4.3.10. Let R_α ($\alpha \in \Sigma$) be a family of subrings of a ring R . Let J_α be a left (resp. 2-sided) ideal of R_α . Then the intersection $\bigcap_{\alpha \in \Sigma} J_\alpha$ is a left (resp. 2-sided) ideal of the subring $\bigcap_{\alpha \in \Sigma} R_\alpha$.

Corollary 4.3.11. Let J_α ($\alpha \in \Sigma$) be a family of left (resp. 2-sided) ideals of a ring R . Then the intersection $\bigcap_{\alpha \in \Sigma} J_\alpha$ is also a left (resp. 2-sided) ideal of R .

Proposition 4.3.12. Let J_α ($\alpha \in \Sigma$) be a finite family of left (resp. 2-sided) ideals of a ring R . Then the addition $\sum_{\alpha \in \Sigma} J_\alpha$ is also a left (resp. 2-sided) ideal of R .

More generally, if J_α ($\alpha \in \Sigma$) is an infinite (countable or uncountable) family of left (resp. 2-sided) ideals of a ring R , then the subset $\{\sum x_\alpha \mid x_\alpha \in J_\alpha, x_\alpha \neq 0 \text{ for only finitely many } \alpha\}$ is also a left (resp. 2-sided) ideal of R .
