

ARTHUR LI

# ABSTRACT ALGEBRA

# *Introduction*

THIS COLLECTION of notes serve as a guide to mastering abstract algebra with content from undergraduate to graduate level course. The notes combine knowledge from different sources, including course notes and textbooks used in the courses.

## *Prerequisites*

These notes will assume no familiarity with any aspects of abstract algebra, and builds upon the foundation from Group Theory to more abstract topics such as Categories and Commutative Algebra. A good starting point will be the series on [Visual Group Theory](#) by [Professor Matthew Macauley](#).

Familiarity with basic styles of proof is assumed (contradiction, contrapositive, etc.).

## *Organization and Sources*

This section will be edited as the notes progress towards completion.

# 1 Preliminaries

## 1.1 Introductory Ideas and Definitions

**Definition 1.1.1.** *Class* is a collection  $A$  of objects (elements) such that given any object  $x$  it is possible to determine if  $x$  is a member of  $A$ .

**Definition 1.1.2.** *Axiom of extensionality* asserts that two classes with the same elements are equal.  
(Formally,  $[x \in A \iff x \in B] \Rightarrow A = B$ ).

**Definition 1.1.3.** A class is defined to be a *set* if and only if there exists a class  $B$  such that  $A \in B$ .  
A class that is not a set is called a *proper set*.

**Definition 1.1.4.** *Axiom of class formation* asserts that for any statement  $P(y)$  in the first predicate calculus involve a variable  $y$ , there exists a class  $A$  such that  $x \in A$  if and only if  $x$  is a set and the statement  $P(x)$  is true. The class is denoted  $\{x|P(x)\}$ .

**Definition 1.1.5.** A class  $A$  is a *subclass* of class  $B$  ( $B \supset A$ ) provided  $\forall x \in A, x \in A \iff x \in B$ .  
A subclass  $A$  of a class  $B$  that is itself a set is called a *subset* of  $B$ .  
The *empty or null set* (denoted  $\emptyset$ ) is the set with no elements.

**Definition 1.1.6.** *Power axiom* asserts that for every set  $A$  the class  $P(A)$  of all subsets of  $A$  is itself a set.  
 $P(A)$  is the *power set* of  $A$ , denoted  $2^A$ .

**Definition 1.1.7.** A *family of sets* indexed by (nonempty) class  $I$  is a collection of sets  $A_i$ , one for each  $i \in I$  (denoted  $\{A_i|i \in I\}$ ).

The *union* is defined as  $\bigcup_{i \in I} A_i = \{x|x \in A_i \text{ for some } i \in I\}$ .

The *intersection* is defined as  $\bigcap_{i \in I} A_i = \{x|x \in A_i \text{ for every } i \in I\}$ .

If  $A \cap B = \emptyset$ , then  $A$  and  $B$  are disjoint.

**Definition 1.1.8.** The *relative complement* of  $A$  in  $B$  is the following subclass of  $B$ :  $B - A = \{x|x \in B \text{ and } x \notin A\}$ .

If all classes under discussion are subsets of some fixed set  $U$  (the universe of discussion), then  $U - A = A'$  is the *complement* of  $A$ .

**Definition 1.1.9.** Given classes  $A$  and  $B$ , a *function / map / mapping*  $f$  from  $A$  to  $B$  (written  $f : A \rightarrow B$ ) assigns to each  $a \in A$  exactly one element  $b \in B$ .

Then  $b$  is the value of function at  $a$ , or the *image* of  $a$ , written  $f(a)$ .

$A$  is the *domain* of the function, written  $\text{dom } f$ , and  $B$  is the *range* or *codomain*.

Two functions are *equal* if they have the same domain and range, and have the same value for each element of their common domain.

**Definition 1.1.10.** If  $f : A \rightarrow B$  is a function and  $S \subset A$ , the function from  $S$  to  $B$  given by  $a \mapsto f(a)$ , for  $a \in S$ , is *restriction* of  $f$  to  $S$ , denoted  $f|_S : S \rightarrow B$ .

If  $S \subset A$ , the function  $1_A|_S : S \rightarrow A$  is the *inclusion map* of  $S$  into  $A$ .

**Definition 1.1.11.** Let  $f : A \rightarrow B$  and  $g : B \rightarrow C$  be functions. The *composite* of  $f$  and  $g$  is the function  $A \rightarrow C$  given by  $a \mapsto g(f(a))$ ,  $a \in A$ . This is denoted  $g \circ f$  or simply  $gf$ .

**Definition 1.1.12.** The *diagram of functions* is said to be commutative if  $gf = h$ , or if  $kh = gf$ .

$$\begin{array}{ccc}
 A & \xrightarrow{f} & B \\
 & \searrow h & \swarrow g \\
 & C &
 \end{array}
 \qquad
 \begin{array}{ccc}
 A & \xrightarrow{f} & B \\
 \downarrow h & & \downarrow g \\
 C & \xrightarrow{k} & D
 \end{array}
 \tag{1.1}$$

**Definition 1.1.13.** Let  $f : A \rightarrow B$  be a function. If  $S \subset A$ , the *image of  $S$  under  $f$*  (denoted  $f(S)$ ) is the class  $\{b \in B \mid b = f(a) \text{ for some } a \in S\}$ .

The class  $f(A)$  is the *image of  $f$* , denoted  $\text{Im } f$ .

If  $T \subset B$ , the *inverse image of  $T$*  under  $f$  (denoted  $f^{-1}(T)$ ), is the class  $\{a \in A \mid f(a) \in T\}$ .

**Definition 1.1.14.** A function  $f : A \rightarrow B$  is said to be *injective* (or one-to-one) provided  $\forall a, a' \in A, a \neq a' \Rightarrow f(a) \neq f(a')$ , or  $f(a) = f(a') \Rightarrow a = a'$ .

A function  $f$  is *surjective* (or on-to) provided  $f(A) \approx B$ ; in other words, for each  $b \in B$ ,  $b = f(a)$  for some  $a \in A$ .

A function  $f$  is *bijective* (or one-to-one correspondence) if it is both injective and surjective.

**Definition 1.1.15.** The map  $g : B \rightarrow A$  is a *left inverse* of  $f$  if  $gf = 1_A$ .

The map  $h : B \rightarrow A$  is a *right inverse* of  $f$  if  $fh = 1_B$ .

If a map  $f : A \rightarrow B$  has both a left inverse  $g$  and a right inverse  $h$ , then  $g = g1_B = g(fh) = (gf)h = 1_A h = h$ , and  $g = h$  is the *two-sided inverse*.

## 2 *Group Theory*

2.1 *Basic Axioms*

2.2 *Homomorphisms and Subgroups*

2.3 *Cyclic Groups*

2.4 *Cosets*

2.5 *Normality, Quotient Groups*

2.6 *Isomorphism Theorems*

2.7 *Symmetric, Alternating and Dihedral Groups*

2.8 *Categories, Products, Coproducts, Free Objects*

2.9 *Direct Products, Direct Sums*

2.10 *Free Groups, Free Products*

2.11 *Matrix Groups*

## 3 *Group Structures*

3.1 *Free Abelian Groups*

3.2 *Finitely Generated Abelian Groups*

3.3 *Krull-Schmidt Theorem*

3.4 *Group Action*

3.5 *The Sylow Theorems*

3.6 *Semidirect Products*

3.7 *Normal and Subnormal Series*

## *4 Ring Theory*

*4.1 Basic Axioms*

*4.2 Ring Homomorphisms*

*4.3 Ring Isomorphisms*

*4.4 Ideals, Rings of Fractions, Local Rings*

*4.5 Euclidean Domains, PID, UFD*

## 5 *Modules*

### 5.1 *Basic Axioms*

## 6 *Category Theory*

### 6.1 *Basic Axioms*
